

Example Writeup

1 List of Changes

Below are changes that were made to the existing code

base:

- Created a system call to set the rudeness of a process
- Filled in evaluate.c to run 5 children and record their turn around times.
- Created a new fairly fair scheduler that schedules processes based on their rudeness value.

2 Experiment

I believe that the fairly fair scheduler will reduce the turnaround time of weighted items. I believe this because the fairly fair scheduler is implemented to give priority to those processes, so they should finish faster than they would in RR at the cost of other processes.

The turnaround time was measured across 5 runs of both RR and FF. The measurements are recorded in ticks.

	RR	My Approach
P1	15	0
P2	15	1
P3	15	7
P4	35	52
P5	33	53
avg	23	22

2.1 Results

From the results, I accept my hypothesis. The three prioritized tasks, did complete faster in FF compared to RR.
